

Evaluation area	Excellent (70–75) / Outstanding (76–85) / Exemplary (86–100)	Good (60–64) / Very good (65–69)	Sound (50–59)	Acceptable (40–49)	Insufficient (< 40)
Knowledge and Understanding (25%)	Compelling rationale; incisive research question. Integration and synthesis of course concepts, going beyond classroom teaching. Excellent knowledge adds breadth and depth to introduction, analysis and discussion.	(Clear) rationale for and comprehension of research question. (Very) good knowledge clearly apparent and used to develop scientific argument. Course concepts understood; learning from across the module integrated and synthesised with no major factual errors.	Introduction provides some context for research. Analysis, interpretation and discussion place results in context of course concepts. Some evidence of sound (if limited) knowledge, with few substantive errors.	Significantly restricted context for research; limited attempt to interpret results or link to wider concepts. Acceptable level of knowledge only implicitly demonstrated, with factual errors or misunderstandings.	Research objectives misunderstood. No demonstrable understanding of results' meaning or significance. Frequent or fundamental errors.
Analysis (25%)	Use of sophisticated methods, with account of how they explicitly address research question. Lucid, concise, precise and explicit exposition of methods. Evaluation of extent that biases in data and analysis may influence interpretations.	Analyses appropriate and linked to research question, with rationale for use. Clear and complete description of methods, in just enough detail to reproduce experiment. Consideration of limitations and biases inherent in data and analyses.	Choice of analyses justified, if limited in extent. Methods described sufficiently to attempt repeat of experiment; little irrelevant material. Occasional errors in analyses.	Limited or inappropriate range of analytical techniques employed without justification. Significant omissions or errors in description of methodology. Prominent errors in analyses.	Choice of method unjustifiable or erroneous. Not clear how research was conducted. Analyses incomplete or fundamentally flawed.
Presentation and Evaluation of Results (40%)	Relevant data presented clearly, effectively and unambiguously; key implications immediately obvious. All data further the scientific discussion, with thoughtful interpretation; new insights, set in context of wider literature. Appropriate breadth and depth of literature cited; discussion informed by critical evaluation of relevant sources.	Relevant data clearly presented with appropriate emphasis; limited irrelevant material. Data support plausible ecological, and thus environmental, reconstruction, acknowledging wider significance and concepts from representative literature. Most statements supported by a result or a primary source.	Necessary data documented in an appropriate format; some irrelevant data over-emphasized. Results applied to research question; significance discussed in context of some additional literature. Many statements supported by research findings or literature citations.	Data limited or irrelevant; unsuitable format (e.g. graph, table) obscures signal. Acceptable but restricted evaluation of research findings. Unrepresentative use of primary literature. Data align poorly with discussion.	Data presented irrelevant to report. Research findings not meaningfully discussed. Few statements supported by research findings or literature sources.
Style and Structure (10%)	Mature, engaging and lucid prose; impeccable spelling, punctuation and grammar; scientific terminology used appropriately; correct capitalization and italicization of taxonomic terms; perfect adherence to formatting requirements. Coherent narrative throughout all sections of report, with no irrelevant material, developing strong argument leading to clear conclusion.	Clear and concise prose; few errors in spelling, punctuation, grammar or formatting; minimal waffle; scientific voice used throughout; statements not over-qualified. Consistent citation and reference format. Focussed narrative with few tangents, developing clear argument tied to research question.	Prose legible and generally precise; linguistic errors do not obscure meaning; appropriate formal tone. Fair attempt to follow formatting requirements. Suggestion of overall theme or purpose. Most sections, paragraphs and sentences broadly coherent. Results and interpretations clearly separated.	Difficult to follow without careful reading; impossible to skim. Some phrases ambiguous or misleading; terminology used inappropriately. Sections or paragraphs unconnected. Few clear narrative threads or arguments; many irrelevant tangents.	Incoherent; difficult to follow. Inappropriate tone, language and formatting; inadequately anonymised. Results intermingled with interpretation and discussion; sections absent.
